Partial Thromboplastin Time (PTT)—NCD 190.16

Other Names/Abbreviations: **PTT** Basic plasma coagulation function is readily assessed with a few simple laboratory tests: The Partial Thromboplastin Time (PTT), Prothrombin Time (PT), Thrombin Time (TT), or a quantitative fibrinogen determination. The PTT test is an in vitro laboratory test used to assess the intrinsic coagulation pathway and monitor heparin therapy.

HCPCS/CPT Codes 85730 Thromboplastin time, partial (PTT); plasma or whole blood

ICD-10 Coding Guidance For ICD-10 coding guidance related to this test, click this link to MedLearn's companion manual: [Laboratory ICD-10 Coding Assistant](#).

Frequency Limitations and Guidelines **Limitations**
No specific limitations listed. See other frequency guidelines below.

Guidelines

Repeat test depends on changes in underlying medical condition and/or heparin dosing.

Prothrombin Time (PT)—NCD 190.17

U Other Names/Abbreviations: PT

Basic plasma coagulation function is readily assessed with a few simple laboratory tests: the Partial Thromboplastin Time (PTT), Prothrombin Time (PT), Thrombin Time (TT), or a quantitative fibrinogen determination. The PT test is one in-vitro laboratory test used to assess coagulation. While the PTT assesses the intrinsic limb of the coagulation system, the PT assesses the extrinsic or tissue factor dependent pathway. Both tests also evaluate the common coagulation pathway involving all the reactions that occur after the activation of factor X. Extrinsic pathway factors are produced in the liver and their production is dependent on adequate vitamin K activity. Deficiencies of factors may be related to decreased production or increased consumption of coagulation factors. The PT/INR is most commonly used to measure the effect of warfarin and regulate its dosing. Warfarin blocks the effect of vitamin K on hepatic production of extrinsic pathway factors.

A PT is expressed in seconds and/or as an international normalized ratio (INR). The INR is the PT ratio that would result if the WHO reference thromboplastin was used in performing the test.

Current medical information does not clarify the role of laboratory PT testing in patients who are self monitoring. Therefore, the indications for testing apply regardless of whether or not the patient is also PT self-testing.

U ICD-10 Coding Guidance

For ICD-10 coding guidance related to this test, click this link to MedLearn's companion manual: [Laboratory ICD-10 Coding Assistant](#).

U Frequency Limitations and Guidelines

Limitations

Every 2 to 3 weeks for stable patients.

Guidelines

When an ESRD patient is tested for PT, testing more frequently than weekly requires documentation of medical necessity.

In patient on stable warfarin therapy, repeat test not usually needed for 2 to 3 weeks.

Repeat depends on changes in underlying medical condition and/or warfarin dosing.

Serum Iron Studies—NCD 190.18

U Other Names/Abbreviations: None

Serum iron studies are useful in the evaluation of disorders of iron metabolism, particularly iron deficiency and iron excess. Iron studies are best performed when the patient is fasting in the morning and has abstained from medications that may influence iron balance.

Iron deficiency is the most common cause of anemia. In young children on a milk diet, iron deficiency is often secondary to dietary deficiency. In adults, iron deficiency is usually the result of blood loss and is only occasionally secondary to dietary deficiency or malabsorption. Following major surgery the patient may have iron deficient erythropoietin for months or years if adequate iron replacement has not been given. High doses of supplemental iron may cause the serum iron to be elevated. Serum iron may also be altered in acute and chronic inflammatory and neoplastic conditions.

Total Iron Binding Capacity (TIBC) is an indirect measure of transferrin, a protein that binds and transports iron. TIBC quantifies transferrin by the amount of iron that it can bind. TIBC and transferrin are elevated in iron deficiency, and with oral contraceptive use, and during pregnancy. TIBC and transferrin may be decreased in malabsorption syndromes or in those affected with chronic diseases. The percent saturation represents the ratio of iron to the TIBC.

Assays for ferritin are also useful in assessing iron balance. Low concentrations are associated with iron deficiency and are highly specific. High concentrations are found in hemosiderosis (iron overload without associated tissue injury) and hemochromatosis (iron overload with associated tissue injury). In these conditions the iron is elevated, the TIBC and transferrin are within the reference range or low, and the percent saturation is elevated. Serum ferritin can be useful for both initiating and monitoring treatment for iron overload.

Transferrin and ferritin belong to a group of serum proteins known as acute phase reactants, and are increased in response to stressful or inflammatory conditions and also can occur with infection and tissue injury due to surgery, trauma or necrosis. Ferritin and iron/TIBC (or transferrin) are affected by acute and chronic inflammatory conditions, and in patients with these disorders, tests of iron status may be difficult to interpret.

Serum Iron Studies—NCD 190.18

U ICD-10-CM Codes Covered by Medicare Program

Guidelines

If a normal serum ferritin level is documented, repeat testing would not ordinarily be medically necessary unless there is a change in the patient's condition, and ferritin assessment is needed for the ongoing management of the patient.

When an end-stage renal disease (ESRD) patient is tested for ferritin, testing more frequently than every 3 months requires documentation of medical necessity.

Collagen Crosslinks, Any Method—NCD

190.19

U Other Names/Abbreviations:
None

Collagen crosslinks, part of the matrix of bone upon which bone mineral is deposited, are biochemical markers the excretion of which provides a quantitative measurement of bone resorption. Elevated levels of urinary collagen crosslinks indicate elevated bone resorption. Elevated bone resorption contributes to age-related and postmenopausal loss of bone leading to osteoporosis and increased risk of fracture. The collagen crosslinks assay can be performed by immunoassay or by high performance liquid chromatography (HPLC). Collagen crosslink immunoassays measure the pyridinoline crosslinks and associated telopeptides in urine.

Bone is constantly undergoing a metabolic process called turnover or remodeling. This includes a degradation process, bone resorption, mediated by the action of osteoclasts, and a building process, bone formation, mediated by the action of osteoblasts. Remodeling is required for the maintenance and overall health of bone and is tightly coupled; that is, resorption and formation must be in balance. In abnormal states of bone remodeling, when resorption exceeds formation, it results in a net loss of bone. The measurement of specific, bone-derived resorption products provides analytical data about the rate of bone resorption.

Osteoporosis is a condition characterized by low bone mass and structural deterioration of bone tissue, leading to bone fragility and an increased susceptibility to fractures of the hip, spine, and wrist. The term primary osteoporosis is applied where the causal factor in the disease is menopause or aging. The term secondary osteoporosis is applied where the causal factor is something other than menopause or aging, such as long-term administration of glucocorticosteroids, endocrine-related disorders (other than loss of estrogen due to menopause), and certain bone diseases such as cancer of the bone.

With respect to quantifying bone resorption, collagen crosslink tests can provide adjunct diagnostic information in concert with bone mass measurements. Bone mass measurements and biochemical markers may have complementary roles to play in assessing effectiveness of osteoporosis treatment. Proper management of osteoporosis patients, who are on long-term therapeutic regimens, may include laboratory testing of biochemical markers of bone turnover, such as collagen crosslinks, that provide a profile of bone turnover responses within weeks of therapy. Changes in collagen crosslinks are determined following commencement of antiresorptive therapy. These can be measured over a shorter time interval when compared to bone mass density. If bone resorption is not elevated, repeat testing is not medically necessary.

↳ Frequency Limitations and Guidelines

↳ Frequency Limitations and Guidelines

Limitations

Limits vary based on therapy, but annually once therapy regime is established.

Guidelines

One or two baseline assays from specified urine collections on separate days...

Followed by a repeat assay about 3 months after starting anti-resorptive therapy...

Followed by a repeat assay in 12 months after the previous 3-month assay above.

Thereafter not more than annually, unless there is a therapy change, in which case an additional test may be indicated 3 months after new therapy begins.

Blood Glucose Testing—NCD 190.20

U Other Names/Abbreviations: None

This policy is intended to apply to blood samples used to determine glucose levels. Blood glucose determination may be done using whole blood, serum or plasma. It may be sampled by capillary puncture, as in the fingerstick method, or by vein puncture or arterial sampling. The method for assay may be by color comparison of an indicator stick, by meter assay of whole blood or a filtrate of whole blood, using a device approved for home monitoring, or by using a laboratory assay system using serum or plasma. The convenience of the meter or stick color method allows a patient to have access to blood glucose values in less than a minute or so and has become a standard of care for control of blood glucose, even in the inpatient setting.

U HCPCS/CPT Codes

82947 Glucose; quantitative, blood (except reagent strip)

82948 Glucose; blood, reagent strip

82962 Glucose, blood by glucose monitoring device cleared by FDA for home use.

U ICD-10 Coding Guidance

For ICD-10 coding guidance related to this test, click this link to MedLearn's companion manual: [Laboratory ICD-10 Coding Assistant](#).

U Frequency Limitations and Guidelines

Limitations

Four times annually, unless otherwise indicated to be reasonable and necessary.

Code 82947 (only) may be reported for diabetes screening tests. For patients diagnosed with pre-diabetes, limit to two annual screenings. For patients not diagnosed as pre-diabetic or never tested, limit to one annual screening.

Guidelines

Up to four times annually for quantitative blood glucose.

More frequent testing depends upon other factors: age, type of diabetes, degree of control, complications, and co-morbid conditions.

Code 82947 (only) may be reported for diabetes screening tests. For patients diagnosed with pre-diabetes, limit to two annual screenings. For patients not diagnosed as pre-diabetic or never tested, limit to one annual screening. For eligibility, certain risk factors must be present.

If repeat testing is performed, a diagnosis code (e.g., diabetes) should be reported to support medical necessity. Repeat testing may be indicated where results are normal in patients with conditions of a continuing risk of glucose metabolism abnormality (e.g., monitoring glucocorticoid therapy).

Glycated Hemoglobin/Glycated Protein— NCD 190.21

U Other Names/Abbreviations: None

The management of diabetes mellitus requires regular determinations of blood glucose levels. Glycated hemoglobin/protein levels are used to assess long-term glucose control in diabetes. Alternative names for these tests include glycated or glycosylated hemoglobin or Hgb, hemoglobin glycated or glycosylated protein, and fructosamine.

Glycated hemoglobin (equivalent to hemoglobin A1) refers to total glycosylated hemoglobin present in erythrocytes, usually determined by affinity or ion-exchange chromatographic methodology. Hemoglobin A1c refers to the major component of hemoglobin A1, usually determined by ion-exchange affinity chromatography, immunoassay or agar gel electrophoresis. Fructosamine or glycated protein refers to glycosylated protein present in a serum or plasma sample. Glycated protein refers to measurement of the component of the specific protein that is glycated usually by colorimetric method or affinity chromatography.

Glycated hemoglobin in whole blood assesses glycemic control over a period of 4-8 weeks and appears to be the more appropriate test for monitoring a patient who is capable of maintaining long-term, stable control. Measurement may be medically necessary every 3 months to determine whether a patient's metabolic control has been on average within the target range. More frequent assessments, every 1-2 months, may be appropriate in the patient whose diabetes regimen has been altered to improve control or in whom evidence is present that intercurrent events may have altered a previously satisfactory level of control (for example, post-major surgery or as a result of glucocorticoid therapy). Glycated protein in serum/plasma assesses glycemic control over a period of 1-2 weeks. It may be reasonable and necessary to monitor glycated protein monthly in pregnant diabetic women. Glycated hemoglobin/protein test results may be low, indicating significant, persistent hypoglycemia, in nesidioblastosis or insulinoma, conditions which are accompanied by inappropriate hyperinsulinemia. A below normal test value is helpful in establishing the patient's hypoglycemic state in those conditions.

U Frequency Limitations and Guidelines

Limitations

Not more than every 3 months, unless otherwise indicated to be reasonable and necessary.

Guidelines

Every 3 months for a controlled diabetic patient.

Glycated Hemoglobin/Glycated Protein—NCD 190.21

↳ ICD-10-CM Codes Covered by Medicare Program

Uncontrolled type 1 or 2 diabetes mellitus patients may require tests more than four times a year. More frequent in situations proven to be medically necessary.

No more frequently than once a month for diabetic pregnant women.

Thyroid Testing—NCD 190.22

U Other Names/Abbreviations: None

Thyroid function studies are used to delineate the presence or absence of hormonal abnormalities of the thyroid and pituitary glands. These abnormalities may be either primary or secondary and often but not always accompany clinically defined signs and symptoms indicative of thyroid dysfunction.

Laboratory evaluation of thyroid function has become more scientifically defined. Tests can be done with increased specificity, thereby reducing the number of tests needed to diagnose and follow treatment of most thyroid disease. Measurements of serum sensitive thyroid-stimulating hormone (TSH) levels, complemented by determination of thyroid hormone levels [free thyroxine (fT-4) or total thyroxine (T4) with Triiodothyronine (T3) uptake] are used for diagnosis and follow-up of patients with thyroid disorders. Additional tests may be necessary to evaluate certain complex diagnostic problems or on hospitalized patients, where many circumstances can skew tests results. When a test for total thyroxine (total T4 or T4 radioimmunoassay) or T3 uptake is performed, calculation of the free thyroxine index (FTI) is useful to correct for abnormal results for either total T4 or T3 uptake due to protein binding effects.

U HCPCS/CPT Codes

84436 Thyroxine; total

84439 Thyroxine; free

84443 Thyroid stimulating hormone (TSH)

84479 Thyroid hormone (T3 or T4) uptake or thyroid hormone binding ratio (THBR)

U Frequency Limitations and Guidelines

Limitations

Twice annually, unless otherwise indicated to be reasonable and necessary.

Guidelines

Twice annually in clinically stable patients.

More frequent testing may be reasonable and necessary for patients whose thyroid therapy has been altered, or in whom symptoms or signs of hyperthyroidism or hypothyroidism are noted.

Lipids Testing—NCD 190.23

U Other Names/Abbreviations: None

Lipoproteins are a class of heterogeneous particles of varying sizes and densities containing lipid and protein. These lipoproteins include cholesterol esters and free cholesterol, triglycerides, phospholipids and A, C, and E apoproteins. Total cholesterol comprises all the cholesterol found in various lipoproteins.

Factors that affect blood cholesterol levels include age, sex, body weight, diet, alcohol and tobacco use, exercise, genetic factors, family history, medications, menopausal status, the use of hormone replacement therapy, and chronic disorders such as hypothyroidism, obstructive liver disease, pancreatic disease (including diabetes), and kidney disease.

In many individuals, an elevated blood cholesterol level constitutes an increased risk of developing coronary artery disease. Blood levels of total cholesterol and various fractions of cholesterol, especially low density lipoprotein cholesterol (LDL -C) and high density lipoprotein cholesterol (HDL-C) are useful in assessing and monitoring treatment for that risk in patients with cardiovascular and related diseases. Blood levels of the above cholesterol components including triglyceride have been separated into desirable, borderline and high-risk categories by the National Heart, Lung, and Blood Institute in their report in 1993. These categories form a useful basis for evaluation and treatment of patients with hyperlipidemia. Therapy to reduce these risk parameters includes diet, exercise and medication, and fat weight loss, which is particularly powerful when combined with diet and exercise.

U HCPCS/CPT Codes

- 80061 Lipid panel
- 82465 Cholesterol, serum or whole blood, total
- 83700 Lipoprotein, blood; electrophoretic separation and quantitation
- 83701 Lipoprotein blood; high resolution fractionation and quantitation of lipoproteins including lipoprotein subclasses when performed (e.g., electrophoresis, ultracentrifugation)
- 83704 Lipoprotein, blood; quantitation of lipoprotein particle numbers and lipoprotein particle subclasses
- 83718 Lipoprotein, direct measurement; high density cholesterol (HDL cholesterol)
- 83721 Lipoprotein, direct measurement, LDL cholesterol
- 84478 Triglycerides

U Frequency Limitations and Guidelines

Limitations

The panel may be covered annually, unless otherwise indicated to be reasonable and necessary. Generally, the limit is no more than twice

annually. Refer to NCD for frequency of component testing, which may vary based on therapy regime.

Code 80061, 82465, 83718, or 84478 may be reported for cardiovascular disease screening once every 5 years.

Guidelines

One lipid panel (80061) annually when: 1) monitoring long-term anti-lipid dietary or pharmacological therapy and 2) when following patients with borderline high total or low-density lipoprotein (LDL) cholesterol level. For interim visits, and if the patient does not have hypertriglyceridemia, measurement of serum total cholesterol (82465) or LDL (83721) should suffice.

For monitoring dietary or pharmacological therapy, any one component of the panel or a measured LDL may be medically necessary up to six times the first year.

More frequent total cholesterol high-density lipoprotein (HDL) cholesterol, LDL cholesterol, and triglyceride testing may be indicated for marked elevations or for changes to anti lipid therapy due to inadequate initial patient response to dietary or pharmacological therapy.

The LDL cholesterol or total cholesterol may be measured three times yearly after treatment goals have been achieved.

Lipid panel would generally not be indicated more than twice per year when evaluating non-specific, chronic liver abnormalities.

Code 80061, 82465, 83718, or 84478 may be reported for cardiovascular disease screening once every 5 years. This limitation applies regardless of ordering pattern.

Digoxin Therapeutic Drug Assay—NCD

190.24

Other Names/Abbreviations: A digoxin therapeutic drug assay is useful for diagnosis and prevention of digoxin toxicity, and/or prevention for under dosage of digoxin.
None

HCPCS/CPT Codes 80162 Digoxin (Therapeutic Drug Assay)

ICD-10 Coding Guidance For ICD-10 coding guidance related to this test, click this link to MedLearn’s companion manual: [Laboratory ICD-10 Coding Assistant](#).

Frequency Limitations and Guidelines

Limitations

Annually, unless clinical situation indicates need for repeat test (e.g., digoxin toxicity or dosage revision).

Guidelines

Annually once a steady state is achieved.

It is reasonable to check digoxin 1 week after a change in dosage or medication.

Based on the clinical situation, in cases of digoxin toxicity, testing may need to be done more than once a week.

U Frequency Limitations and Guidelines **Limitations**

Varies based on diagnosis and therapy.

Guidelines

Serum CEA determinations are generally not indicated more frequently than once per chemotherapy treatment cycle for patients with metastatic solid tumors.

Every 2 months post-surgery for patients who have had colorectal carcinoma.

Every 2 to 3 months in patients with initial stage II or stage III disease for at least 2 years after diagnosis (if resection of liver metastasis is indicated).

Testing with diagnosis of an in-situ carcinoma is not reasonably done more frequently than once, unless the result is abnormal, in which case it may be repeated once.

Human Chorionic Gonadotropin— NCD 190.27

Other Names/Abbreviations: **HCG** Human Chorionic Gonadotropin (hCG) is useful for monitoring and diagnosis of germ cell neoplasms of the ovary, testis, mediastinum, retroperitoneum, and central nervous system. In addition, hCG is useful for monitoring pregnant patients with vaginal bleeding, hypertension and/or suspected fetal loss.

HCCPCS/CPT Codes 84702 Gonadotropin, chorionic (hCG); quantitative

Frequency Limitations and Guidelines

Limitations

Review NCD guidelines based on therapy.

Guidelines

Obtain as part of initial preoperative work-up for women presenting with a suspicious pelvic mass to be used as a baseline for purposes of post-operative monitoring. Follow up during the first month post-treatment and at completion of chemotherapy.

Surveillance measurements are generally obtained every 3 months for 2 years, every 6 months for the next 3 years, and yearly thereafter.

CA 125 levels also indicate therapeutic response in the presence of advanced or recurrent disease, so may be obtained before each treatment cycle.

Obtain three serum levels during the first month post-treatment to determine the patient's CA 125 half-life.

Obtain levels again at completion of chemotherapy as index of residual disease.

Not covered to evaluate patients with signs or symptoms suggesting malignancy, although test may be necessary to assess either the presence of recurrent disease or the patient's response to subsequent treatment cycles.

Not covered to aid in the differential diagnosis of patients with a pelvic mass. Use a single "tumor marker" in following a patient with a pelvic mass.

Prostate Specific Antigen—NCD 190.31

Other Names/Abbreviations: PSA

Prostate Specific Antigen (PSA), a tumor marker for adenocarcinoma of the prostate, can predict residual tumor in the post-operative phase of prostate cancer. Three to 6 months after radical prostatectomy, PSA is reported to provide a sensitive indicator of persistent disease. Six months following introduction of antiandrogen therapy, PSA is reported of distinguishing patients with favorable response from those in whom limited response is anticipated.

PSA when used in conjunction with other prostate cancer tests, such as digital rectal examination, may assist in the decision-making process for diagnosing prostate cancer. PSA also, serves as a marker in following the progress of most prostate tumors once a diagnosis has been established. This test is also an aid in the management of prostate cancer patients and in detecting metastatic or persistent disease in patients following treatment.

HCPCS/CPT Codes

84153 Prostate Specific Antigen (PSA), total

ICD-10 Coding Guidance

For ICD-10 coding guidance related to this test, click this link to MedLearn's companion manual: [Laboratory ICD-10 Coding Assistant](#).

Frequency Limitations and Guidelines

Limitations

Annually. Refer to CMS program transmittals for coverage of screening procedures (G0103).

Guidelines

Annually for patients with lower urinary tract signs or symptoms (exceptions may apply if there's a medical condition change). Refer to CMS manuals and memorandums for coverage details of screening procedures (G0103).

Testing with diagnosis of an in-situ carcinoma is not reasonably done more frequently than once, unless the result is abnormal, in which case it may be repeated once.

Gamma Glutamyl Transferase—NCD 190.32

U Other Names/Abbreviations: GGT

Gamma glutamyl transferase (GGT) is an intracellular enzyme that appears in blood following leakage from cells. Renal tubules, liver, and pancreas contain high amounts, although the measurement of GGT in serum is almost always used for assessment of Hepatobiliary function. Unlike other enzymes which are found in heart, skeletal muscle, and intestinal mucosa as well as liver, the appearance of an elevated level of GGT in serum is almost always the result of liver disease or injury. It is specifically useful to differentiate elevated alkaline phosphatase levels when the source of the alkaline phosphatase increase (bone, liver, or placenta) is unclear. The combination of high alkaline phosphatase and a normal GGT does not, however, rule out liver disease completely.

As well as being a very specific marker of Hepatobiliary function, GGT is also a very sensitive marker for hepatocellular damage. Abnormal concentrations typically appear before elevations of other liver enzymes or biliuria are evident. Obstruction of the biliary tract, viral infection (e.g., hepatitis, mononucleosis), metastatic cancer, exposure to hepatotoxins (e.g., organic solvents, drugs, alcohol), and use of drugs that induce microsomal enzymes in the liver (e.g., cimetidine, barbiturates, phenytoin, and carbamazepine) all can cause a moderate to marked increase in GGT serum concentration. In addition, some drugs can cause or exacerbate liver dysfunction (e.g., atorvastatin, troglitazone, and others as noted in FDA Contraindications and Warnings.)

GGT is useful for diagnosis of liver disease or injury, exclusion of hepatobiliary involvement related to other diseases, and patient management during the resolution of existing disease or following injury.

U ICD-10 Coding Guidance

For ICD-10 coding guidance related to this test, click this link to MedLearn's companion manual: [Laboratory ICD-10 Coding Assistant](#).

U Frequency Limitations and Guidelines

Limitations

Generally, repeat test not indicated for normal results. Refer to NCD guidelines for conditions that may support repeat testing.

Guidelines

Repeats generally not necessary after a normal result, unless new indications present.

When GGT is used to determine if other abnormal enzyme tests reflect liver abnormality rather than other tissue, it is generally not necessary to repeat more than one time per week.

Hepatitis Panel/Acute Hepatitis Panel— NCD 190.33

U Other Names/Abbreviations: This panel consists of the following tests:
None

- § Hepatitis A antibody (HAAb), IgM antibody;
- § Hepatitis B core antibody (HBcAb), IgM antibody;
- § Hepatitis B surface antigen (HBsAg); and
- § Hepatitis C antibody.

Hepatitis is an inflammation of the liver resulting from viruses, drugs, toxins, and other etiologies. Viral hepatitis can be due to one of at least five different viruses, designated hepatitis A, B, C, and E. Most cases are caused by hepatitis A virus (HAV), hepatitis B virus (HBV), or hepatitis C virus (HCV).

HAV is the most common cause of hepatitis in children and adolescents in the United States. Prior exposure is indicated by a positive IgG anti-HAV. Acute HAV is diagnosed by IgM anti-HAV, which typically appears within four weeks of exposure, and which disappears within three months of its appearance. IgG anti-HAV is similar in the timing of its appearance, but it persists indefinitely. Its detection indicates prior effective immunization or recovery from infection. Although HAV is spread most commonly by fecal-oral exposure, standard immune globulin may be effective as a prophylaxis.

HBV produces three separate antigens (surface, core, and e (envelope) antigens) when it infects the liver, although only hepatitis B surface antigen (HBsAg) is included as part of this panel. Following exposure, the body normally responds by producing antibodies to each of these antigens; one of which is included in this panel: hepatitis B surface antibody (HBsAb)-IgM antibody. HBsAg is the earlier marker, appearing in serum four to eight weeks after exposure, and typically disappearing within six months after its appearance. If HBsAg remains detectable for greater than six months, this indicates chronic HBV infection. HBcAb, in the form of both IgG and IgM antibodies, are next to appear in serum, typically becoming detectable two to three months following exposure. The IgM antibody gradually declines or disappears entirely one to two years following exposure, but the IgG usually remains detectable for life. Because HBsAg is present for a relatively short period and usually displays a low titer, a negative result does not exclude an HBV diagnosis. HBcAb, on the other hand, rises to a much higher titer and remains elevated for a longer period of time, but a positive result is not diagnostic of acute disease, since it may be the result of a prior infection. The last marker to appear in the course of a typical infection is HBsAb, which appears in serum four to six months following exposure to infected blood or body fluids; in the U.S., sexual transmission accounts for 30% to 60% of new cases of HBV infection.

The diagnosis of acute HBV infection is best established by documentation of positive IgM antibody against the core antigen (HBcAb-IgM) and by identification of a positive hepatitis B surface antigen (HBsAg). The diagnosis of chronic HBV infection is established primarily by identifying a positive hepatitis B surface antigen (HBsAg) and demonstrating positive IgG antibody directed against the core antigen (HBcAb-IgG). Additional tests such as hepatitis B e antigen (HBeAg) and hepatitis B e antibody (HBeAb),

Hepatitis Panel/Acute Hepatitis Panel—NCD 190.33

⌋ HCPCS/CPT Codes

the envelope antigen and antibody, are not included in the hepatitis panel, but may be of importance in assessing the infectivity of patients with HBV. Following completion of a HBV vaccination series, HBsAb alone may be used monthly for up to six months, or until a positive result is obtained, to verify an adequate antibody response.

HCV is the most common cause of post-transfusion hepatitis; overall HCV is responsible for 15% to 20% of all cases of acute hepatitis, and is the most common cause of chronic liver disease. The test most commonly used to identify HCV measures HCV antibodies, which appear in blood two to four months after infection. False positive HCV results can occur. For example, a patient with a recent yeast infection may produce a false positive anti-HCV result. For this reason, at present positive results usually are confirmed by a more specific technique. Like HBV, HCV is spread exclusively through exposure to infected blood or body fluids.

This panel of tests is used for differential diagnosis in a patient with symptoms of liver disease or injury. When the time of exposure or the stage of the disease is not known, a patient with continued symptoms of liver disease despite a completely negative hepatitis panel may need a repeat panel approximately two weeks to two months later to exclude the possibility of hepatitis. Once a diagnosis is established, specific tests can be used to monitor the course of the disease.

⌋ Frequency Limitations and Guidelines

Limitations

The panel may be covered to detect a viral hepatitis infection before and after a liver transplant. Refer to NCD guidelines for frequency of component testing, which may vary based on diagnosis.

Guidelines

Repeats panels may be needed 2 weeks to 2 months after a completely negative hepatitis panel if symptoms continue. Specific tests thereafter to monitor disease course.

HbsAb alone may be used monthly for up to 6 months or until a positive result is obtained after completion of HBV vaccination series.

Fecal Occult Blood Test—NCD 190.34

U Other Names/Abbreviations: FOBT

The Fecal Occult Blood Test (FOBT) detects the presence of trace amounts of blood in stool. The procedure is performed by testing one or several small samples of one, two or three different stool specimens.

This test may be performed with or without evidence of iron deficiency anemia, which may be related to gastrointestinal blood loss. The range of causes for blood loss include inflammatory causes, including acid-peptic disease, non-steroidal anti-inflammatory drug use, hiatal hernia, Crohn's disease, ulcerative colitis, gastroenteritis, and colon ulcers. It is also seen with infectious causes, including hookworm, strongyloides, ascariasis, tuberculosis, and enteroamebiasis. Vascular causes include angiodysplasia, hemangiomas, varices, blue rubber bleb nevus syndrome, and watermelon stomach. Tumors and neoplastic causes include lymphoma, leiomyosarcoma, lipomas, adenocarcinoma and primary and secondary metastases to the GI tract. Drugs such as nonsteroidal anti-inflammatory drugs also cause bleeding. There are extra gastrointestinal causes such as hemoptysis, epistaxis, and oropharyngeal bleeding. Artfactual causes include hematuria, and menstrual bleeding. In addition, there may be other causes such as coagulopathies, gastrostomy tubes or other appliances, factitial causes, and long distance running.

Three basic types of fecal hemoglobin assays exist, each directed at a different component of the hemoglobin molecule.

1. Immunoassays recognize antigenic sites on the globin portion and are least affected by diet or proximal gut bleeding, but the antigen may be destroyed by fecal flora.
2. The heme-porphyrin assay measures heme-derived porphyrin and is least influenced by enterocolic metabolism or fecal storage. This assay does not discriminate dietary from endogenous heme. The capacity to detect proximal gut bleeding reduces its specificity for colorectal cancer screening but makes it more useful for evaluating overall GI bleeding in case finding for iron deficiency anemia.
3. The guaiac-based test is the most widely used. It requires the peroxidase activity of an intact heme moiety to be reactive. Positivity rates fall with storage. Fecal hydration such as adding a drop of water increases the test reactivity but also increases false positivity.

Of these three tests, the guaiac-based test is the most sensitive for detecting lower bowel bleeding. Because of this sensitivity, it is advisable, when it is used for screening, to defer the guaiac-based test if other studies of the colon are performed prior to the test. Similarly, this test's sensitivity may result in a false positive if the patient has recently ingested meat. Both of these cautions are appropriate when the test is used for screening, but when appropriate indications are present, the test should be done despite its limitations.

Non-Covered Codes for All Lab NCDs

U Reasons for Denial for all Lab NCDs

The following are reasons for denial of Medicare coverage for all lab NCDs:

- § Tests for screening purposes that are performed in the absence of signs, symptoms, complaints, or personal history of disease or injury are not covered except as explicitly authorized by statute.
- § Tests for administrative purposes, including exams required by insurance companies, business establishments, government agencies, or other third parties, are not covered.
- § Tests that are not reasonable and necessary for the diagnosis or treatment of an illness or injury are not covered by statute.
- § Failure to provide documentation of the medical necessity of tests might result in denial of claims. The documentation may include notes documenting relevant signs, symptoms, or abnormal findings that substantiate the medical necessity for ordering the tests. In addition, failure to provide independent verification that the test was ordered by the treating physician (or qualified nonphysician practitioner) through documentation in the physician's office might result in denial.
- § A claim for a test for which there is a national coverage policy will be denied as not reasonable and necessary if the claim is submitted without an ICD-10-CM code or narrative diagnosis listed as covered in the policy unless other medical documentation justifying the necessity is submitted with the claim.
- § If a national coverage policy identifies a frequency expectation, a claim for a test that exceeds that expectation may be denied as not reasonable and necessary, unless it is submitted with documentation justifying increased frequency.
- § Tests that are not ordered by a treating physician or other qualified treating nonphysician practitioner acting within the scope of their license and in compliance with Medicare requirements will be denied as not reasonable and necessary.
- § Failure of the clinical laboratory performing the test to have the appropriate Clinical Laboratory Improvement Amendments of 1988 (CLIA) certificate will result in denial of claims.

U Codes Not Covered

The codes in the following table are never covered by Medicare for a diagnostic lab testing service. If a code from this section is given as the reason for the test, the test may be billed to the Medicare beneficiary without billing Medicare first, because the service is not covered by statute—in most instances because it is performed for screening purposes and is not within an exception. The beneficiary, however, does have a right to request the claim be submitted to Medicare.

| Code | Description |

Introduction

This manual is designed to help your laboratory staff and referring physicians meet the documentation requirements of the ICD-10 diagnosis coding system, as it relates to the lab tests governed by Medicare National Coverage Determinations (NCDs). In this resource you will find:

- a general explanation of national and local coverage determinations and what they require;
- an ICD-10-CM coding primer, describing the reasons for the change from ICD-10, coding conventions and guidelines, and considerations for staff preparation and training; and
- specific coding guidance for each lab NCD, including CPT and a crosswalk from ICD-9 to ICD-10 for the diagnosis codes most relevant to each NCD.

If you have purchased this manual as a companion product to MedLearn's [Laboratory Coverage Reference](#), you will also find active links to related Medicare coverage guidance for each NCD.

U National Coverage Determinations

Background

The Balanced Budget Act of 1997 mandated the use of a negotiated rulemaking committee to develop national coverage and administrative policies for clinical diagnostic laboratory services payable under Medicare Part B. The purpose was to promote Medicare program integrity and national uniformity, and simplify administrative requirements for clinical diagnostic services. A final rule stating these policies was published on November 23, 2001. It established 23 national coverage and administrative policies, numbered 190.12 through 190.34, that lay out the requirements for:

- beneficiary information required to be submitted with each claim or order for laboratory services;
- the medical condition for which a laboratory test is reasonable and necessary as defined by the Social Security Act;
- the appropriate use of procedure codes in billing for a laboratory test, including the unbundling of laboratory services;
- the medical documentation that is required by a Medicare contractor at the time a claim is submitted for a laboratory test;
- record keeping requirements in addition to any information required to be submitted with a claim, including physicians' obligations regarding these requirements;
- procedures for filing claims and for providing remittances by electronic media; and
- limitations on the frequency of coverage for the same services performed on the same individual.

Some policies were drafted and became active before the guidelines for the laboratory national coverage and administrative policies were issued.

Therefore, the earlier documents contain variations in the details for coding requirements and specificity of coverage.

Before an NCD can take effect, CMS must first issue a manual instruction, program memorandum, CMS ruling, or *Federal Register* notice giving specific directions to claims-processing contractors. That issuance, which includes an effective date, is the NCD. If appropriate, the agency must also change billing and claims processing systems and issue related instructions to allow for payment. The NCD will be published in the *Medicare NCD Manual*. An NCD becomes effective as of the date listed in the transmittal that announces the revision.

The Scope of NCDs

An NCD sets forth whether Medicare will cover specific services, procedures, or technologies on a national basis. Medicare contractors are required to follow NCDs. If an NCD does not specifically exclude an indication or circumstance, or if the item or service is not mentioned at all in an NCD or in a Medicare manual, it is up to Medicare contractors to make a coverage decision regarding that circumstance, item, or service (see “[Local Coverage Determinations](#)” below).

In total there are 34 unique national coverage policies that the Centers for Medicare & Medicaid Services (CMS) identifies under the heading of Pathology and Laboratory. In the list below, the policy number precedes the name of the NCD:

- 190.1—Histocompatibility Testing
- 190.2—Diagnostic Pap Smears
- 190.3—Cytogenetic Studies
- 190.4—Electron Microscope
- 190.5—Sweat Test
- 190.6—Hair Analysis
- 190.7—Human Tumor Stem Cell Drug Sensitivity Assays
- 190.8—Lymphocyte Mitogen Response Assays
- 190.9—Serologic Testing for Acquired Immunodeficiency Syndrome (AIDS)
- 190.10—Laboratory Tests—CRD Patients
- 190.11—Home Prothrombin Time INR Monitoring for Anticoagulation Management
- 190.12—Urine Culture, Bacterial
- 190.13—Human Immunodeficiency Virus (HIV) Testing (Prognosis Including Monitoring)
- 190.14—Human Immunodeficiency Virus (HIV) Testing (Diagnosis)
- 190.15—Blood Counts

- 190.34—Fecal Occult Blood Test (FOBT)

This coding handbook focuses on the 23 diagnostic test NCDs numbered 190.12 through 190.34, which are included in the Medicare NCD Manual found at http://www.cms.gov/mcd/index_chapter_list.asp. Future editions of this handbook may be revised to encompass other policies as well.

Those responsible for laboratory coding and billing should be aware of two additional policies:

- 90.1—Pharmacogenomic Testing for Warfarin Response—is listed under the heading of Genetics and addresses the molecular pathology procedures for pharmacogenomic testing of CYP2C9 or VKORC1 alleles to predict a patient’s response to warfarin therapy.
- 300.1—Obsolete or Unreliable Diagnostic Tests—lists 28 laboratory tests that are obsolete or involve methodologies replaced by newer ones offering better sensitivity or specificity.

Another six coverage policies that CMS places under the heading of Prevention deal with tests in both the clinical laboratory and the cytology laboratory for procedures covered under Medicare’s preventive services benefit:

- 210.1—Prostate Cancer Screening Tests (PSA)
- 210.2—Screening Pap Smears and Pelvic Examinations for Early Detection of Cervical or Vaginal Cancer
- 210.3—Colorectal Cancer Screening Tests
- 210.7—Screening for the Human Immunodeficiency Virus (HIV) Infection
- 210.10—Screening for Sexually Transmitted Infections (STIs) and High-Intensity Behavioral Counseling (HIBC) to Prevent STIs [chlamydia]

infection, gonorrhea infection, syphilis infection, hepatitis B virus (HBV infection)]

- 210.13—Screening for Hepatitis C Virus (HCV) in Adults.

Beyond the policies identified above, others under the heading of Hematology/Immunology/Oncology establish coverage criteria for transfusion medicine, stem cell transplant, and therapeutic pheresis procedures:

- 110.5—Granulocyte Transfusion
- 110.7—Blood Transfusion
- 110.8—Blood Platelet Transfusion
- 110.8.1—Stem Cell Transplantation
- 110.14—Apheresis/Therapeutic Pheresis.

Coverage Policies and ICD-10-CM

All policies were updated in 2015 to accommodate the move to ICD-10-CM. Local coverage determinations were renumbered and reissued for dates of service on or after October 1, 2015. To monitor updates, consult the Medicare Coverage Database at <http://www.cms.gov/medicare-coverage-database/overview-and-quick-search.aspx>.

U Local Coverage Determinations

In addition to national coverage policy as expressed in the NCDs, local policies may affect billing of certain laboratory procedures. The local policies—known as local coverage determinations (LCDs)—set forth whether your regional Medicare Administrative Contractor (MAC) will cover specific services, procedures, or technologies on a local basis.

Coverage and documentation requirements of the LCDs vary from one region to the other. For that reason this handbook does not address the individual pathology and laboratory tests that MACs may include in their local coverage policies for Part A or Part B services.

Related information, such as the statutory exclusions or benefit categories, is published separately by MACs in articles issued in bulletins or on their websites. CMS also publishes this information online at: http://www.cms.gov/MCD/index_article_bystate.asp.

Other online information regarding Medicare payment policy may be found in a variety of CMS transmittals published online at http://www.cms.gov/Transmittals/01_Overview.asp or within the *Medicare Benefit Policy Manual* at <http://www.cms.gov/Manuals/IOM/list.asp>.

U General Coverage Restrictions

“Reasonable and Necessary” Denials

A claim for a test for which there is a national or local coverage determination must be submitted with a valid diagnosis code that is listed as covered in the policy. Otherwise the claim will be denied as not “reasonable and necessary,” unless other medical documentation justifying the necessity is submitted with the claim.

Click for:

[Table of Contents](#)[Back to Previous Page](#)

Frequency Limits

If a national or local policy identifies a frequency expectation, a claim for a test that exceeds that expectation may be denied as not reasonable and necessary, unless it is submitted with documentation justifying an increased frequency.

Tests Not Ordered by a Qualified Provider

Tests that are not ordered by a treating physician or other qualified treating nonphysician practitioner (nurse practitioners, nurse midwives, nurse anesthetists, clinical nurse specialists, and physician assistants) acting within the scope of their license and in compliance with Medicare requirements will be denied as not reasonable and necessary.

U Documenting the Claim

In the clinical laboratory setting one rarely sees credentialed health information management (HIM) diagnosis coding staff within the front-office operations, where patient registration and specimen accessioning occur. The laboratory depends on the diagnosis information or clinical history submitted by the ordering physician on the request for testing. The results of clinical lab tests are not interpreted by a pathologist; therefore, the information received at the time of the order is the information that will support the diagnosis submitted on the claim for reimbursement.

It is this information submitted on the claim that will—or will not—document the medical necessity and support payment for testing.

For outpatient or non-patient testing, the diagnosis will many times be based on signs and symptoms or the reason for testing (such as routine screening), rather than a definitive diagnosis. The reason for coding signs and symptoms is that the coding rules for outpatient claims stipulate that the encounter must be coded only to the level that is definitive at the time of billing. This means that outpatient encounters are not coded for “rule out conditions” or “suspected disease.” For instance, a request for urinalysis with culture would be most appropriately submitted with a sign/symptom of urinary frequency rather than rule out urinary tract infection. Another option would be the “personal history” diagnosis for screening purpose.

- R35.0 Frequency of micturition
- Z87.440 Personal history of urinary (tract) infections

It would not be appropriate to report N39.0 for a rule out condition:

- N39.0 Urinary tract infection, site not specified

As the United States has moved from the ICD-9-CM system to ICD-10-CM, the laboratory must accept and process the new code format, which is explained below. If your laboratory accepts a narrative diagnosis rather than a code on the request for testing, it is imperative that staff know the documentation terminology that is required due to the higher level of specificity inherent in the ICD-10 coding system.

The ICD-10 Coding System

Impact on Providers

On October 1, 2015, the ICD-10-CM and ICD-10-PCS code sets replaced the ICD-9-CM and ICD-9-CM Volume 3 code sets that were used for the previous three decades to report medical diagnoses and inpatient procedures, respectively. These abbreviations refer to the International Classification of Diseases, 10th Edition, Clinical Modification (CM) and Procedure Coding System (PCS).

ICD-10 diagnosis and procedure codes must be used for services provided on or after October 1, 2015. Claims for services provided before that date must use ICD-9 diagnosis codes. Claims that contain ICD-9 codes after that date cannot be processed.

All entities covered by the Health Insurance Portability and Accountability Act (HIPAA) of 1996, not just those that submit Medicare and Medicaid claims, were required to switch to ICD-10. This includes healthcare providers and suppliers, payers, clearinghouses, and billing services.

Organizations that are not covered by HIPAA (such as worker compensation programs, property and casualty insurance plans, and prison health systems) are not required to switch to ICD-10-CM. Providers who submit claims to non-HIPAA entities may have to continue to use ICD-9-CM for non-HIPAA covered payers and switch to ICD-10-CM for those covered under HIPAA.

ICD-10-CM is to be used in all healthcare settings, while ICD-10-PCS is primarily for inpatient hospitals. However, a hospital may voluntarily choose to assign PCS codes across the board or when an outpatient is admitted to the inpatient setting. In the latter instance, the outpatient procedure must be coded in PCS because the claim will be submitted as an inpatient claim. In addition, some payers may decide to require them, so it will be important for providers to verify this with all their payers.

Keep in mind that the changes brought by the ICD-10 code sets do not change CPT coding for outpatient procedures and physician services, nor do they affect HCPCS codes.

Coding System Differences

Whereas ICD-9-CM codes were three to five characters in length, ICD-10-CM codes are three to seven alphanumeric characters. Each character of the ICD-10 code has a specific purpose. The first three characters identify “category.” Etiology, anatomic site, severity or other clinical detail are identified by characters four through seven, and character seven defines “extension.”

The expanded number of characters in the ICD-10 diagnosis codes provides greater specificity, as shown in the following examples:

- ICD-9-CM 790.2, Abnormal glucose, was an incomplete code for billing, as additional specificity was required and achieved by adding a fifth digit. Each fifth digit code added clarity to specify the type of abnormality. The five-digit specific codes were valid until the October 2015 ICD-10 implementation:
 - w 790.21 Impaired fasting glucose or elevated fasting glucose
—Directly converts to ICD-10-CM R73.01
 - w —790.22 Impaired glucose tolerance test (oral) or elevated glucose tolerance test
—Directly converts to ICD-10-CM R73.02

Click for:

[Table of Contents](#)[Back to Previous Page](#)

- w 790.29 Other abnormal glucose includes abnormal glucose NOS, abnormal non-fasting glucose, hyperglycemia NOS or pre-diabetes NOS
 - Directly converts to ICD-10-CM R73.09
- ICD-9-CM 790.6, Other abnormal blood chemistry, was a valid diagnosis code until the implementation of ICD-10. Now, however, claims submitted with a diagnosis of abnormal blood chemistry, not otherwise specified, will not have a single directly equivalent ICD-10 code. Potential options would include:
 - w R78.89 Finding of other specified substances, not normally found in blood, or
 - w R79.0 Abnormal level of blood mineral, or
 - w R79.89 Other specified abnormal findings of blood chemistry.

Benefits and Concerns

The switch to the ICD-10 coding system occurred for many reasons, including the following:

- The structure of ICD-9 limited the number of new codes that can be created, and many ICD-9 categories were full.
- The ICD-9 code descriptions contained outdated and obsolete terms that are inconsistent with current medical practice.
- ICD-9 codes did not provide enough data about patients' medical conditions and hospital inpatient procedures.

ICD-10-CM incorporates much greater clinical detail and specificity. According to CMS, it includes a "more robust definition of severity, comorbidities, complications, sequela, manifestations, causes, and a variety of other important parameters that characterize the patient's condition." The new system will also accommodate newly developed diagnoses and procedures, innovations in technology and treatment, performance-based payment systems, and more accurate billing.

To make the coding system consistent with current clinical practice, new and revised terminology and disease classifications have been updated. The new classification system provides much better data, which will help with the following:

- Measuring the quality, safety, and efficacy of care
- Reducing the need for attachments to explain the patient's condition
- Designing payment systems and processing claims for reimbursement
- Conducting research, epidemiological studies, and clinical trials
- Setting health policy
- Conducting operational and strategic planning
- Designing healthcare delivery systems
- Monitoring resource utilization
- Improving clinical, financial, and administrative performance
- Preventing and detecting healthcare fraud and abuse
- Tracking public health risks.

In spite of the benefits, many physicians are concerned about the 68,000 diagnosis codes and 87,000 procedure codes in the ICD-10 system. Compared with the ICD-9 system's 13,000 diagnosis codes and 3,000 procedure codes, it is easy to see why they may be initially intimidated by the new system.

However, according to CMS, nearly 25 percent of the ICD-10-CM codes are the same except for indicating laterality—the right side of the patient's body versus the left. Another 25 percent of the codes differ only in the way they distinguish among an "initial encounter" versus a "subsequent encounter" versus "sequela."

Organizational Challenges

Although daunting, the increase in the number of codes and the number of code characters seems to pale in comparison to other far-reaching implications identified in by CMS on its website. CMS warned providers that the transition would "change how you do business—from registration and referrals to superbills and software upgrades." The ICD-10 conversion will affect all aspects of the revenue cycle and the core systems, including HIM, patient financial services, utilization management, and quality measures.

For example, many chief financial officers who have analyzed their finances expect to lose money over the next 5 years. Many hospital leaders view inadequate physician documentation to be one of their biggest concerns under the ICD-10 system. The reason is that incomplete physician documentation leads to incomplete code assignments.

There are other reasons for possible revenue loss:

- Declines in coder and clinician productivity that could affect revenue—AAPC (formerly the American Association of Procedural Coders) estimates a productivity decrease between 10 percent and 25 percent
- Growing queries to physicians from coders regarding code selection
- More frequent billing inquiries from health plans
- More mistakes in code assignments, as coders learn the new system
- Delays in bill submittal and reimbursement—CMS and the American Health Information Management Association (AHIMA) estimate that accounts receivable days will increase 20 to 40 percent
- More denials and rejections
- Some MS-DRG shifts—some to a higher-weighted DRG, some to a lower weighted one, others to non-specific DRGs.

In addition, if internal information technology systems do not interconnect properly, billings can be delayed, which will reduce cash flow. If external systems such as claims scrubbers and billing vendors are not prepared, billings will be delayed. If payers are not prepared, payment for claims will be delayed.

Another area of concern is a possible coder shortage. Experts say that many coders are over the age of 50 and will either consider early retirement or change professions to avoid the complications of ICD-10. Therefore, each organization needs to determine whether it will lose a portion of its current coding team and whether to hire new certified coders or outsource the additional work.

The American Medical Association sums up the upcoming challenges by saying, “The move to ICD-10 will not be easy. ... The complexity of ICD-10 provides many benefits because of the increased level of detail conveyed in the codes. The complexity also underscores the need to be adequately trained on ICD-10 in order to fully understand reporting changes that will come with the new code sets” (Frequently Asked Questions at <http://www.ama-assn.org/ama/pub/physician-resources/solutions-managing-your-practice/coding-billing-insurance/hipaahealth-insurance-portability-accountability-act/transaction-code-set-standards/icd10-code-set/icd10-faq.page>).

Role-Specific Training

ICD-10 implementation will affect all providers in some way, so all staff must receive some level of training. Coding professionals are key to revenue under the new system, and they should receive the most in-depth training. Clinical documentation improvement (CDI) specialists, in addition to selected physicians and non-physician practitioners (NPPs), also will require significant education.

Physicians and NPPs have one primary responsibility, which one industry expert called the “cornerstone for ICD-10 transition success”: to provide the most comprehensive clinical documentation possible, which medical coders will translate into ICD-10 codes. Training for physicians and NPPs should be focused and continuous until they get it right.

Non-coding and non-clinical staff will need to be made aware of the new system and have a working knowledge of it. These personnel would include the following departments and others:

- Patient registration/specimen accessioning
- Patient financial services
- Central scheduling
- Utilization review
- Quality improvement
- Ancillary departments.

In the ICD-10-CM/PCS final rule, CMS estimated that inpatient coders would need 50 hours of training. This estimate presumes that coding professionals already possess the required knowledge in the biomedical sciences that will be needed to correctly apply codes using the ICD-10 system, such as anatomy, physiology, pathophysiology, pharmacology, and medical terminology. Those who do not possess this knowledge will need in-depth or refresher courses.

AHIMA estimated that, on average, coders should focus 16 hours of training on ICD-10-CM, 24 hours on ICD-10-PCS, and 10 hours on additional practice. According to AAPC, training should have averaged around 70 to 80 hours, which includes time for coders, CDI specialists, and physicians to work together to practice documentation and coding.

Readiness Checklist

How does your laboratory intend to monitor and maintain or improve compliance with ICD-10 after the 2015 implementation? The following are some approaches:

- Direct code to ICD-10 based on documentation that the referring physician/practitioner provides.

Click for:

[Table of Contents](#)[Back to Previous Page](#)

- Require the referring physician/practitioner to assign ICD-10-CM codes.
- Require the referring physician/practitioner to provide narrative supporting documentation as well as assign ICD-10-CM codes.
- Continue to accept ICD-9-CM codes from the ordering physician/practitioner and use a mapping tool to convert them to ICD-10-CM.
- Consider addition of a certified coding professional to the front office processes of registration and accessioning to evaluate physician documentation of diagnoses and to assign the most accurate ICD-10-CM based on the narrative information provided.

As we continue to adjust to the details of ICD-10-CM documentation requirements, many clinical laboratories, outreach service laboratories, and laboratories in the independent setting struggle to maintain compliance with the reporting and billing guidelines of private and government payers. When test orders include procedures affected by coverage limitations that require a specific diagnosis for coverage and are limited by utilization guidelines, it is of utmost importance to obtain diagnosis information that represents the highest level of specificity. The following suggestions can assist in continued education and training within the laboratory setting.

1. Review the material in this ICD-10 Primer.
2. Assign a lead person to manage the ICD-10 effort.
3. Create tracking and trending mechanisms that provide information by test, by ordering provider, and by payer.
4. Form a project team; assign responsibility with timelines for completion (a compliance plan).
5. Identify trends by meaningful groupings such as missing information/unable to process requisition, change in coverage policy impacting acceptable diagnosis for test, denied payment/not supported by information within payer coverage policy, and so on.
6. Identify each area of the laboratory where diagnosis codes are submitted or assigned, monitor and track missing or incomplete diagnosis submission, and determine the need to update or revise documents in order to adhere to coding standards for ICD-10-CM (such as requisitions, electronic health record requests, interpretive or reporting forms, client contracts, payer contracts, and so on).
7. Identify any clinical documentation implications (such as laterality or use of unspecified codes) and determine whether training may be needed.
8. Identify the ordering/referring providers who are associated with high-frequency errors or lack of documentary information. Develop methods for communication and designate a “communication champion” to work with the providers.

9. Begin your remediation.
10. Identify any budget impacts—Are software upgrades necessary? How much additional training is indicated?

U Coding Guidelines

Diagnosis Coding Guidelines for Labs

Codes that describe symptoms and signs, as opposed to diagnoses, are acceptable for reporting purposes when a related definitive diagnosis has not been established (confirmed) by the provider (*ICD-10-CM Official Guidelines for Coding and Reporting*, FY 2016).

Outpatient Coding Guidelines—Simplified

Many times, the entire purpose of a laboratory test is to rule out a suspected condition and to help the ordering physician make a definitive diagnosis so that treatment can proceed. From the perspective of the laboratory, it is not the lab's responsibility to make a diagnosis but rather to assist in ruling out or confirming the suspected condition or disease. Frequently, the diagnosis received by the laboratory is found to support indications for the patient's office visit but has no relation to the laboratory tests being ordered.

A diagnosis submitted for laboratory testing should represent the underlying sign, symptom, or condition that has prompted the physician to request testing.

When testing is performed to follow up on prior test results or to monitor a patient's progress following confirmation of diagnosis based on prior test results, submit the confirmed diagnosis on the request for follow-up testing. Also provide signs, symptoms, or additional diagnoses if needed to further explain the need for repeat testing.

When a prior laboratory test is normal or does not provide confirmation of a suspected diagnosis, the request for follow-up testing should again be submitted to the laboratory with documentation of the signs or symptoms that have prompted the physician to obtain additional testing. Do not provide a questionable or uncertain diagnosis. Do not submit an unconfirmed diagnosis as if it exists.

- Diagnoses documented as "probable," "suspected," "questionable," "rule out," or "working diagnosis" should not be coded as though they exist. Rather, code the conditions to the highest degree of certainty for that encounter/visit, such as signs, symptoms, abnormal test results, exposure to communicable disease, or other reasons for the visit.
- The testing of a person to rule out or to confirm a suspected diagnosis because the patient has a sign and/or symptom is a diagnostic test, not a screening. In these cases, the sign or symptom should be used to explain the reason for the test.
- Preventive screening is the testing for disease or disease precursors—in the absence of signs, symptoms, or known exposure—so that early detection and treatment can be provided for those who test positive for the disease. In this instance it may be a patient's lifestyle that supports the medical indication for testing (such as problems related to lifestyle, Z72.0–Z72.9).

Using This Resource

Conversions between ICD-9 and ICD-10 may require clinical interpretation in order to determine the most appropriate codes for your specific situation. The material presented in this handbook is intended for educational purpose only and is not intended to influence test utilization or selection of diagnosis.

Medicare distinguishes “screening” from “diagnostic” uses of tests. Screening means testing for disease or disease precursors when no specific sign, symptom, or diagnosis is present and the beneficiary has not been exposed to a disease. The preventive screening benefit provides coverage to support early detection and treatment.

In contrast, diagnostic testing means testing to rule out or confirm a suspected diagnosis because of a sign and/or symptom in the beneficiary. In such a case, *the sign or symptom should be used to explain the reason for the test*. Remember that in the outpatient setting, rule-out and suspected diagnoses are not covered. Providing information specific to the patient’s presenting complaint, sign, or symptom supports the guidance to code to the highest level of specificity known at the time of testing.

Some laboratory tests are covered by the Medicare program for screening purposes, such as NCD 210.1, Prostate Cancer Screening Tests. However, this manual focuses only on coding policies for diagnostic uses of laboratory services, such as NCD 190.31, the test for prostate specific antigen (PSA).

The diagnoses selected for coding examples within each NCD policy discussion were chosen based on signs, symptoms, conditions, or definitive diagnosis codes often reported on Medicare claims and associated with the CPT code included in the policy. No preference was given to diagnoses that did or did not meet coverage criteria.

190.12 Urine Culture—Bacterial

U CPT Coding Guidance

The CPT codes for urine culture address two different levels of specimen processing. Selecting the correct CPT code to support medical necessity will most likely depend on the place of service where the culture and any additional identification and/or sensitivity tests are performed.

In the acute hospital setting, 87086 is most likely the appropriate procedure code. This code defines Culture, bacterial, urine; quantitative, colony count where a urine culture colony count is performed to determine the approximate number of bacteria present per milliliter of urine. The number of units of service is determined by the number of specimens. Note that 87086 as described in the Additional Coding Guidelines of the NCD manual includes both the culture and the colony count. The presumptive identification from a quantitative urine culture should not be coded as 87088. However, the definitive identification of pathogens requiring the use of additional testing—for example, biochemical test procedures on colonies—is coded as 87088. The number of units of service is determined by the number of isolates.

Code 87088 also represents the most appropriate code for specimen processing that involves a commercial kit that uses manufacturer-defined media for isolation, presumptive identification, and quantitation of morphotypes present. This procedure is most frequently seen in the clinic setting. The number of units of service is determined by the number of specimens. In this scenario there would most likely be no additional use of 87088 to code for definitive identification by biochemical test procedures.

For surgical procedures involving major manipulations of the genitourinary tract, such as manipulation or removal of kidney stones, preoperative examination to detect occult infection may be indicated. The routine performance of urine culture as a preoperative screening procedure is not covered.

190.13 Human Immunodeficiency Virus (HIV) Testing (Prognosis Including Monitoring)

U CPT Coding Guidance

Quantification assays of HIV plasma RNA are used prognostically to assess relative risk for disease progression and predict time to death, as well as to assess efficacy of anti-retroviral therapies over time. Procedures coded with 87536 are specifically limited to disease prognosis and monitoring and should not be performed simultaneously with other nucleic acid detection procedures for HIV-1 (87534, 87535) or HIV-2 (87537, 87538).

The procedures listed below would not be utilized during the process of establishing a diagnosis of HIV infection. Performance of a baseline level may be medically necessary in any patient with confirmed HIV infection. When performed in conjunction with assessment of CD4+ T cell numbers, the accuracy of disease progression and/or predicted time of death is enhanced.

190.14 Human Immunodeficiency Virus (HIV) Testing (Diagnosis)

U CPT Coding Guidance

Close review of the recommended test cascade for HIV testing by the ordering provider is strongly suggested, as well as the laboratory. Incorrect procedure selection or improper utilization will likely result in denial of claims. Based on NCD guidelines, CPT code 86701 (HIV-1) or 86703 (HIV-1 and HIV-2) represents initial testing. If initial test results are negative and clinical indications support a suspicion of HIV-2, the next steps would include testing specifically for HIV-2 (86702). Confirmatory testing (86689) is indicated only after repeat positive or indeterminate results for HIV-1 and/or HIV-2.

According to information in the laboratory NCD manual, the HIV antigen tests have been replaced by the more sensitive viral RNA assays.

CPT code 87534 or 87535 is used to detect HIV-1 RNA where indicated. CPT code 87537 or 87538 is used to detect HIV-2 RNA where indicated.

190.15 Blood Counts

U CPT Coding Guidance

The complete blood count (CBC) is a multi-component test represented by a single CPT code. Available codes in this series allow for ordering and coding a complete blood count (with or without differential count) or individual components, such as hemoglobin or hematocrit or white blood cell count. When the ordering provider requests only a component of the comprehensive panel (such as hemoglobin or hematocrit or WBC), the remaining components of the CBC are not covered and should not be billed.

A number of different signs, symptoms, or disease states may indicate the need for a hematology test. Patients may present with anything from a disorder of the blood or bone marrow to inflammation, infection, coagulopathies, neoplasms, or exposure to toxic substances. The various indications for this range of tests result in the CBC being one of the most commonly requested clinical laboratory tests. Repeat testing may not be indicated unless abnormal results are found, or unless there is a change in clinical condition.

A screening procedure would be a hematology procedure ordered for patients who are asymptomatic or who do not have a condition that could be expected to result in a hematological abnormality, and is not a covered service. Any ICD-10-CM code **not listed** in either the non-covered section of this policy or the listing of statutorily non-covered diagnoses for laboratory testing will be considered covered for the hematology procedures listed. This policy is published with more than 800 pages of non-covered diagnoses.

190.16 Partial Thromboplastin Time (PTT)

U CPT Coding Guidance

The PTT test is an in vitro laboratory test used to assess the intrinsic coagulation pathway and monitor heparin therapy.

Potential denial for lack of medical necessity exists when both the PTT and prothrombin time (PT) are ordered as part of a preoperative admission protocol. Except during transitions between heparin and warfarin therapy, in general the PTT and PT are not both necessary together to assess the effect of anticoagulation therapy. The diagnosis must separately justify the medical indication for performing a PTT in the outpatient setting. Preoperative evaluation may be indicated for patients with a personal or family history of bleeding or who are on heparin therapy.

Potential denial for lack of medical necessity exists when both the PT and PTT are ordered as part of a preoperative admission protocol. Except during transitions between heparin and warfarin therapy, in general the PTT and PT are not both necessary together to assess the effect of anticoagulation therapy. The diagnosis must separately justify the medical indication for performing both the PT and PTT evaluation in the outpatient setting. Preoperative evaluation may be indicated for patients with a personal or family history of bleeding or who are on warfarin therapy.

190.18 Serum Iron Studies

U CPT Coding Guidance

Ferritin, iron, and either iron binding capacity or transferrin are useful in the differential diagnosis of iron deficiency, anemia, and iron overload conditions. Iron studies should be used to diagnose and manage iron deficiency or iron overload states. Iron studies are considered medically necessary only when results impact the management of the primary diagnosis or might warrant direct treatment of an iron disorder or condition.

Ferritin as a preoperative test may be indicated for a patient who recently donated autologous blood prior to the surgery, or for a patient with a confirmed diagnosis of anemia.

According to the coverage policy, it is ordinarily not necessary to measure both transferrin and total iron binding capacity (TIBC) at the same time, because TIBC is an indirect measure of transferrin. Ordering providers should review the utilization guidelines and limitations for testing stated within this policy. Frequency limitations do apply to this coverage policy.

190.19 Collagen Crosslinks, any Method

U CPT Coding Guidance

Testing of collagen crosslinks is typically performed on a population of patients who have not yet reached an age to qualify for Medicare benefit. Candidates for testing are categorized as “fast losers” of bone. Patients of Medicare age usually would fall into one of two categories: previously diagnosed and stabilized through appropriate therapy, or having significant and non-reversible loss of bone mass. Further testing would not be indicated.

Some Medicare beneficiaries are younger, and coverage under the Medicare benefit may be established based on signs, symptoms, or definitive diagnosis. Other causes of rapid bone loss such as glucocorticoid therapy may support medical necessity of testing but should be limited to those patients who are documented as demonstrating signs or symptoms suggesting clinical relevance.

NCD limitations include staged analysis over 12 months as indicated by utilization guidelines.

190.20 Blood Glucose Testing

U CPT Coding Guidance

There are numerous indications for diagnostic testing to identify an elevated or depressed glucose level. Conditions include, coma, seizure or epilepsy, confusion, abnormal hunger, abnormal weight loss or gain, and loss of sensation. Glucose values may also be indicated when monitoring medication effects. Separate coverage requirements are published for preventive screening of Medicare beneficiaries to screen for diabetes or pre-diabetes.

Diagnostic testing may have limited indications for patients presenting with nonspecific signs, symptoms, or diseases not normally associated with abnormal glucose metabolism. Repeat testing may not be indicated unless abnormal results are found or there is a change in clinical condition or in conditions where risk exists. Regardless of the condition, sign, or symptom, supporting documentation will be necessary to support testing that exceeds the Medicare limitation of frequency of coverage.

190.21 Glycated Hemoglobin/Glycated Protein

U CPT Coding Guidance

An abnormally elevated fasting blood glucose level or impaired glucose tolerance or abnormal glucose tolerance test is considered an indication for ordering glycated hemoglobin or glycated protein testing in the absence of the diagnosis of diabetes mellitus. Medicare limits coverage based on the frequency of testing. Testing of a controlled diabetic patient would be considered medically reasonable every 3 months, with monthly testing being indicated for a pregnant female with diabetes. The uncontrolled diabetic may require testing more frequently; however, medical necessity documentation must be present in the patient medical record to support the testing frequency.

190.22 Thyroid Testing

U CPT Coding Guidance

The determination of hormonal abnormalities of the thyroid and pituitary glands relies on results of the thyroid function studies. When the treating provider first evaluates the patient, it will be the clinically defined signs and symptoms that prompt the ordering of tests and that provide the basis for the initial diagnosis codes. Without further diagnostic study, the determination of primary or secondary status will most likely be unknown.

By following the thyroid cascade, the number of tests necessary for diagnosis and treatment can be reduced. Beginning with the thyroid-stimulating hormone (TSH) levels and with consideration of clinical indications either thyroid hormone levels—free thyroxine (fT-4) or total thyroxine (T4) with triiodothyronine (T3) uptake—will be used to establish a definitive diagnosis. The most appropriate test or tests for monitoring the patient will depend on the final diagnosis and treatment plan for the patient with a thyroid disorder. Complex cases may require further study.

Frequency limitations do apply, and testing beyond twice per year requires documentation by the ordering provider to support medical necessity.

190.23 Lipid Testing

U CPT Coding Guidance

Diagnostic testing for cardiac risk factors impacted by cholesterol, triglycerides, and lipoproteins such as LDL and HDL is covered by this policy. For preventive screening for cardiac risk, refer to the CMS benefit manual for coverage of preventive screening.

Therapeutic monitoring of a patient's progress may require testing of at least one of the lipid panel components but may not require frequent ordering of the complete lipid panel. Limitations for frequency do exist. For patients requiring dietary adjustments or pharmacologic therapy, coverage of the lipid panel may be indicated annually. A single component or a direct measured LDL may be indicated for more frequent testing during the first year or when indicated for marked elevation of an analyte or when therapy changes are indicated. Utilization restrictions as well as coding and billing edits do exist for direct measured LDL. Refer to the indication and limitations stated in the diagnostic coverage determination for more detailed information regarding covered and non-covered diagnosis and frequency of testing.

190.24 Digoxin Therapeutic Drug Assay

U CPT Coding Guidance

The therapeutic assay for digoxin is useful in monitoring a patient's serum value to ensure that the dosage is appropriate and that the patient is adhering to instructions for taking medication. The digoxin assay will identify a patient as either being within the therapeutic range, under the expected goal for therapeutic value, or having digoxin toxicity.

Frequent testing may be indicated at initiation of therapy and if the patient status changes, renal function decreases, changes in medication regimen are made, or when signs or symptoms indicate toxicity. For patients whose clinical presentation is unstable or who are found to be digoxin toxic, testing may be required more frequently than once per week. Annual testing may be sufficient for a patient whose therapeutic dose has been established and stabilized. Be certain that medical record documentation supports the frequency of testing and that when indicated the test request includes additional diagnoses to support changes in patient status or additional clinical indications or toxic effects, intentional or unintentional.

This test is not appropriate for patients on digitoxin or treated with digoxin FAB (fragment antigen binding) antibody.

Alpha-fetoprotein (AFP) is useful for the diagnosis of hepatocellular carcinoma in high-risk patients (such as those with alcoholic cirrhosis, cirrhosis of viral etiology, hemochromatosis, and alpha 1-antitrypsin deficiency) and in separating patients with benign hepatocellular neoplasms or metastases from those with hepatocellular carcinoma. As a non-specific tumor associated antigen, AFP serves in marking germ cell neoplasms of the testis, ovary, retroperitoneum, and mediastinum.

190.26 Carcinoembryonic Antigen (CEA)

U CPT Coding Guidance

The carcinoembryonic antigen may have indications as either a preoperative value that is helpful in postoperative decision making and management of the patient, or as a marker for following patients with colorectal carcinoma for the purpose of making treatment decisions. Additionally, when a more specific marker is not expressed by a tumor, the CEA marker may be indicated as an alternative. According to the indications noted in NCD 190.26, “a single tumor marker will suffice in following patients with colorectal carcinoma or other malignancies that express such tumor markers.”

Refer to American Society of Clinical Oncology guidelines for frequency of testing when following patient treatment and tumor response to therapy. The limitations noted in this NCD state that serum determinations are

generally not indicated more frequently than once per chemotherapy treatment cycle for patients with metastatic solid tumors which express CEA or every two months post-surgical treatment for patients who have had colorectal carcinoma. However, it may be proper to order the test more frequently in certain situations, for example, when there has been a significant change from prior CEA level or a significant change in patient status which could reflect disease progression or recurrence. Testing with a diagnosis of an in situ carcinoma is not reasonably done more frequently than once, unless the result is abnormal, in which case the test may be repeated once.

U CPT Coding Guidance

While most female Medicare beneficiaries are not of child-bearing age, this NCD does cover some indications related to pregnancy, such as monitoring pregnant patients with vaginal bleeding, hypertension, and/or suspected fetal loss. However, most claims submitted to the Medicare program for quantitative measurement of human chorionic gonadotropin (hCG) are for monitoring and diagnosis of germ cell neoplasms of the ovary, testis, mediastinum, retroperitoneum, and central nervous system.

The NCD document does include a statement limiting the frequency of testing to once per month for diagnostic purposes, while stating that the test may be performed as needed for monitoring patient progress and treatment.

190.28 Tumor Antigen by Immunoassay— CA 125

U CPT Coding Guidance

The CA 125 tumor marker when elevated may reflect tumor size and grade. As a preoperative measure, a CA 125 level may be obtained as part of the initial work-up for women presenting with a suspicious pelvic mass to be used as a baseline for purposes of postoperative monitoring. Monitoring the change in value after surgery and/or chemotherapy is typically seen when treating ovarian cancer.

CA 125 is a high molecular weight serum tumor marker elevated in 80 percent of patients who present with epithelial ovarian carcinoma. It is also elevated in carcinomas of the fallopian tube, endometrium, and endocervix. An elevated level may also be associated with the presence of a malignant mesothelioma or primary peritoneal carcinoma. CA 125 levels are also an important indicator of a patient's response to therapy in the presence of advanced or recurrent disease. In this scenario, CA 125 levels may be obtained before each treatment cycle.

Frequency of testing is defined for CA 125 levels and includes specimens obtained at the completion of chemotherapy as an index of residual disease and surveillance measurements obtained every 3 months for 2 years, every 6 months for the next 3 years, and yearly thereafter.

190.29 Tumor Antigen by Immunoassay— CA 15-3/CA 27.29

U CPT Coding Guidance

The tumor antigens CA 15-3 and CA 27.29 are not intended to be utilized as screening tests. The procedures would not be covered when submitted with an ICD-10-CM code representing signs or symptoms suggestive of malignancy. Utilization of the antigens is most frequently seen in the management of patients with breast cancer. When supported as medically indicated, one antigen will be used consistently for serial testing in order to monitor and manage the treatment of patients with breast cancer. It would most likely not be considered medically necessary to use both antigens to monitor a patient.

When elevated, serum concentration of markers may reflect tumor size and grade. The test may be necessary to assess either the presence of recurrent disease or the patient's response to treatment with subsequent treatment cycles.

190.30 Tumor Antigen by Immunoassay— CA 19-9

U CPT Coding Guidance

The tumor antigen CA 19-9 is not intended to be a screening test and is not covered for evaluating patients with signs or symptoms suggesting malignancy. The covered indications for the antigen would include monitoring the response of certain malignancies to therapy, assessing whether a residual tumor exists post-surgical therapy, or assessing either the presence of recurrent disease or the patient's response to treatment with subsequent treatment cycles.

When elevated, serum concentration of these markers may reflect tumor size and grade.

190.31 Prostate Specific Antigen (PSA)

U CPT Coding Guidance

The testing of prostate specific antigen (PSA) as covered by NCD 190.31 is specific to the tumor marker utilized for diagnosing adenocarcinoma of the prostate, and may also be used to predict a residual tumor in the postoperative phase of prostate cancer. The test value should be used in conjunction with other procedures such as a digital rectal exam in order to guide the provider in diagnosing the patient with prostate cancer. The diagnoses below are provided for consideration and are representative of when the PSA would be ordered as a diagnostic test based on sign, symptom, disease state, or recent history of diagnosis requiring monitoring of disease progress.

Frequency and utilization limitations as well as age criteria do apply to the coverage of this diagnostic procedure.

CPT code 84153 should not be billed for a special screening PSA test performed as part of the patient's annual preventive benefit. A separate CMS policy addresses coverage of special screening procedures for testing the male patient who presents without lower urinary tract signs or symptoms.

190.32 Gamma Glutamyl Transferase (GGT)

U CPT Coding Guidance

The GGT value is a very specific marker of hepatobiliary function and hepatocellular damage. The request for GGT may be supported by a variety of indications such as diagnosis of liver disease or injury, exclusion of hepatobiliary involvement related to other diseases, and patient management during the resolution of existing disease or following injury. CGT is used in monitoring patients after transplant surgery.

Utilization limitations do apply and should be reviewed to ensure compliance with testing guidelines.

190.33 Hepatitis Panel/Acute Hepatitis Panel

U CPT Coding Guidance

By definition, hepatitis is an inflammation of the liver. The cause of hepatitis may be a viral infection (the most frequent cause), drugs, toxins, and other etiologies. The specific components of the panel as defined by CPT code 80074 are used in determining the differential diagnosis in a patient with symptoms of liver disease or injury. Once a definitive diagnosis is made, subsequent testing should be based on the specificity of the virus identified in order to monitor the course of the disease.

When the initial panel returns a negative or indeterminate result, it may be necessary to repeat the panel at a point 2–8 weeks later for patients who continue to present with symptoms of liver disease, in order to exclude hepatitis as the possible cause.

For patients requiring a liver transplant, the hepatitis panel is ordered before and after the transplant.

190.34 Fecal Occult Blood Test (FOBT)

U CPT Coding Guidance

The occult blood test represented by this coverage policy is for detecting trace amounts of blood in stool when the patient presents with signs or symptoms of bleeding into the intestinal tract, or with anemia of an unknown etiology. The procedure is performed by testing one or several small samples of one, two, or three different stool specimens that are sequentially collected over a specified period. The CPT code 82272 is billed based on the number of samples submitted for simultaneous determination, even though the collection of individual specimens may have occurred over multiple days.

Code 82272 should not be billed for a special screening occult blood test performed as part of the patient's annual preventive benefit. A separate CMS policy addresses coverage of special screening procedures when testing for colorectal cancer in the absence of signs, symptoms, conditions, or complaints associated with gastrointestinal blood loss. Preventive screening is defined by a unique HCPCS code and has very specific coverage criteria and limitations.
